## **AMENDMENTS TO THE CLAIMS**

## Please amend the Claims as follows.

1 (original): A non-aqueous secondary battery comprising positive and negative electrodes and a lithium salt-containing electrolyte, the battery being at least 30 Wh in energy capacity and at least 180Wh/1 in volume energy density and having a flat shape with a thickness of less than 12 mm.

2 (original): The non-aqueous secondary battery according to Claim 1, wherein the positive electrode contains manganese oxide.

3 (original): The non-aqueous secondary battery according to Claim 1 or 2, wherein the negative electrode is formed by using graphite having an average particle diameter of 1 to 50 mm as active material, a resin as binder, and a metal as current collector, the negative electrode having a porosity of 20 to 35%, an electrode density of 1.40 to 1.70 g/cm<sup>3</sup>, and an capacity of electrode of 400 Ah/cm<sup>3</sup> or higher.

4 (original): The non-aqueous secondary battery according to Claim 3, wherein the negative electrode contains a graphite material obtained by graphitizing mesocarbon microbeads.

5 (original): The non-aqueous secondary battery according to Claim 1 or 2, wherein the negative electrode comprises as active material double-structure graphite particles formed with graphite-based particles and amorphous carbon layers covering the surface of the graphite-based particles, the graphite-based particles having (d002) spacing or (002) planes of not more than 0.34 nm as measured by X-ray wide-angle diffraction method, the amorphous carbon layers having (d002) spacing of (002) planes of 0.34 nm or higher.

6 (original): The non-aqueous secondary battery according to Claim 5, wherein the negative electrode is formed by using double-structure graphite particles having an average particle diameter of 1 to 50 mm as active material, a resin as binder, and a metal as current collector, the negative electrode having a porosity of 20 to 35%, an electrode density of 120 to 1.60 g/cm<sup>3</sup>, and an capacity of electrode of 400 mAh/cm<sup>3</sup> or higher.

7 (original): The non-aqueous secondary battery according to Claim 1 or 2, wherein the negative electrode comprises as active material a carbon material manufactured by mixing at least one of artificial graphite and natural graphite with a carbon material having volatile components on the surface and/or in the inside and baking the mixture.

8 (original): The non-aqueous secondary battery according to Claim 7, wherein the negative electrode is formed by using a resin as binder and a metal as current collector, the negative electrode having a porosity of 20 to 35% an electrode density of 1.20 to 1.60 g/cm<sup>3</sup>, and an capacity of electrode of 400 mAh/cm<sup>3</sup> or higher.

9 (original): The non-aqueous secondary battery according to Claim 1, wherein the front and rear sides of the flat shape are rectangular.

10 (original): The non-aqueous secondary battery according to Claim 1, wherein the wall thickness of a battery case of the non-aqueous secondary battery is not less than 0.2 mm and not more than 1 mm.

27 (original): The secondary-battery control method to be applied to the secondary battery of Claim 1 or 11, comprising the steps of measuring operational parameters of at different portions of the battery and controlling operations of the battery based on the results of the measurement.

28 (original): The secondary battery control method according to Claim 27, wherein the operational parameters to be measured include at least one of the voltage, tension of current, temperature, dimensions, and internal resistance of a secondary battery.
